

HOME WORK 12/09/2026

In this homework, you will practice the concepts of **Class**, **Object**, **Attributes**, and **Methods** in Python.

1. Create a class called **Hero**

The class should have a constructor `__init__()` to initialize all hero information. Each Hero should have the following information:

- `name` – the name of the hero
- `hp` – the hero's health points
- `armor` – the hero's armor
- `damage` – the hero's attack damage

2. Create a method to introduce the hero

Create a method called `introduce()`.

When this method is called, it should print the hero's information.

For example:

```
name: "Arthur"
hp: 3000
armor: 150
damage: 250
```

3. Create Hero objects

Create at least **3 different Hero objects**.

For example:

- One Fighter
- One Mage
- One Marksman

You can choose your own hero names and stats.

4. Call the `introduce()` method

Call the `introduce()` method for each Hero object so that the information of all heroes is displayed
